$\succeq^{**}$ revealed indirectly preferred.

$x(p, w)$: WL. HDO. Convex / Unique

$V(p, w)$: $\uparrow w, \downarrow p$. HDO. quasiconvex continuous.

$p h(p, u) = e(p, u)$

$h(p, w)$: Tight: HDO, CLD.

$e(p, u)$: $\uparrow p, \uparrow u$. HD $\perp$. concave.

VNM Axiom: ① Order (complete & transitive) ② Mixture continuity ③ Independence.

finite $\mathbb{Z}$.

② + ③ $\Leftrightarrow \forall L' > L > L'' \exists \alpha \in (0,1)$
 $s.t. L \sim \alpha L' + (1-\alpha) L''$

VNM Expected Utility: $\exists u: \mathbb{Z} \rightarrow \mathbb{R}$ s.t. $\forall L^F, U(L^F) = \int u(x) dF(x)$.

Risk Averse: $ce(F, u) \leq EF, \forall F$.

$\Leftrightarrow u(\cdot)$ concave.

$\Leftrightarrow \pi(F) \geq 0, \forall F$.

$\succeq^u$ is more RA than $\succeq^v$. ① $S_{const} \succeq^v F \Rightarrow S_{const} \succeq^u F$.

② $ce(F, v) \geq ce(F, u)$. ③ $\pi(F, v) \leq \pi(F, u)$.

④ $\exists f(\cdot)$ concave s.t. $u = f \circ v$.

⑤ $r_A(x, u) \geq r_A(x, v) \forall x$.

Consider a lottery F with domain $[x-\varepsilon, x+\varepsilon]$. ε is small enough. $\forall x$.

$$U(ce(F, u)) = U(EF - \pi(x, u)) = \int_{x-\varepsilon}^{x+\varepsilon} u(z) dF(z)$$

$$\Rightarrow U(EF) - U'(EF) \pi(x, u) + o(\pi) = \int u(EF) + u'(EF)(z-EF) + \frac{1}{2} u''(EF)(z-EF)^2 + o(z^2) dF(z)$$

$$\Rightarrow -U'(EF) \pi(x, u) + o(\pi) = \frac{1}{2} u''(EF) \text{Var} F + \frac{d(\text{Var} F)}{2} \int u'''(\cdot) \text{ is integrable}$$

$$\Rightarrow \boxed{\pi(x, u) + o(\pi)} = -\frac{1}{2} \text{Var} F \frac{u''(EF)}{u'(EF)} =: \boxed{\frac{\text{Var} F}{2} r_A(EF, u)}$$

$\Rightarrow u'''(\cdot)$ bounded
 e.g. $\ln(\cdot)$ unbounded at $\cdot=0$

F on $[x(1-\varepsilon), x(1+\varepsilon)]$: $\boxed{\frac{\pi(x, u)}{x}} = -\frac{1}{2} \text{Var} F \frac{u''(EF)}{u'(EF)} =: \boxed{\frac{\text{Var} F}{2} r_R(EF, u)}$

therefore $EF = EG$. $\text{Var} F > \text{Var} G$

$\Rightarrow F \prec G$

CRRA: $u(x) = \frac{C_1 x^{1-R} + C_0}{1-R}, R \neq 1, u(x) = \ln x, R=1$.

CARA: $u(x) = C_0 e^{-R_A x} + C_1$

FOSD: $F \succeq^{FOSD} G$.

① $\forall$ increasing $u: \int u(x) dF(x) \geq \int u(x) dG(x)$.

② $\forall x, F(x) \leq G(x)$.

③ F is a "Shifting right transform" of G .

SOSD: $F \succeq^{SOSD} G$.

① $\forall$ increasing, concave $u: \int u(x) dF(x) \geq \int u(x) dG(x)$.

② $\forall x, \int^x F(t) dt \leq \int^x G(t) dt$.

③ G is a "Mean-preserving spread" of F .

stochastic
 $F \xrightarrow{H} G$

Savage's Subjective Expected Utility.

$$U(f) = \int_S u \circ f d\mu = \sum_S \mu(S) u(f(S)) : \mu \in \Delta S, \mu: S \rightarrow \mathbb{R} \text{ measure "Subjective Prob"}$$

$$f: S \rightarrow \mathbb{Z} \quad u: \mathbb{Z} \rightarrow \mathbb{R} \text{ index utility}$$

Maximin Model:

$$U(f) = \min_{\mu \in P} \int_S u \circ f d\mu. \quad P \subseteq \Delta S \text{ set of subjective probability.}$$

Motivation: under VNM EU: increasing $U(\cdot) \Rightarrow$ demand for risky asset > 0 . ^{without} knife edge

Evidence from empirical research: $\exists$ Non-participation!

VNM / Savage EU:

$$U(\alpha, p) = p U(\alpha H - \alpha \pi + m) + (1-p) U(\alpha L - \alpha \pi + m).$$

p : objective or subjective.

$$H > \pi > L.$$

$$= p U(m_H) + (1-p) U(m_L).$$

$$\begin{cases} m_H(\alpha) = \alpha(H - \pi) + m \\ m_L(\alpha) = \alpha(L - \pi) + m \end{cases} \Rightarrow \frac{m_H(\alpha) - m}{m_L(\alpha) - m} = \frac{H - \pi}{L - \pi}$$

|slope| of BL = $\frac{H - \pi}{L - \pi}$

$$\text{FOC from } U(\alpha; p): \frac{\partial U}{\partial \alpha}(\alpha, p) = p(H - \pi) u'(m_H) + (1-p)(L - \pi) u'(m_L) = 0$$

$$\Rightarrow \frac{H - \pi}{\pi - L} = \frac{(1-p) u'(m_L)}{p u'(m_H)} \quad \text{BL (slope) = MRS.}$$

If $\alpha = 0$ Nonparticipation is optimal: $m_H = m_L = m \xrightarrow{\text{All DM}} \pi = pH + (1-p)L$ fairly priced.

If $\alpha > 0$ is optimal: $m_H > m_L, u'(m_L) > u'(m_H) \Rightarrow \pi < pH + (1-p)L$ under priced. ^{RA DM}

If $\alpha < 0$ is optimal: $m_L > m_H, u'(m_H) > u'(m_L) \Rightarrow \pi > pH + (1-p)L$ over priced.

$$\text{Maximin EU: } U(m_L, m_H) = \min_{p \in [\underline{p}, \bar{p}]} \{ p U(m_H) + (1-p) U(m_L) \}$$

$$= \min_{p \in [\underline{p}, \bar{p}]} \{ p [U(m_H) - U(m_L)] + U(m_L) \}$$

$$= \begin{cases} \underline{p} [U(m_H) - U(m_L)] + U(m_L) & \text{if } m_H > m_L \\ \bar{p} [U(m_H) - U(m_L)] + U(m_L) & \text{if } m_H \leq m_L \end{cases}$$

$$\text{FOC: } \frac{\partial U}{\partial \alpha} = \begin{cases} \underline{p} (H - \pi) u'(m_H) + (1 - \underline{p}) (L - \pi) u'(m_L) & \text{if } \alpha > 0 \\ \bar{p} (H - \pi) u'(m_H) + (1 - \bar{p}) (L - \pi) u'(m_L) & \text{if } \alpha < 0 \end{cases}$$

If $\alpha = 0$ Nonparticipation is optimal: $m_H = m_L = m$ & $\frac{\partial U}{\partial \alpha}(\underline{p}) < 0$ & $\frac{\partial U}{\partial \alpha}(\bar{p}) > 0$

$$\Rightarrow \pi \in [\underline{p}H + (1 - \underline{p})L, \bar{p}H + (1 - \bar{p})L]$$

If $\alpha > 0$ is optimal: $\pi < \underline{p}H + (1 - \underline{p})L$ pessimistic forecast.

If $\alpha < 0$ is optimal: $\pi > \bar{p}H + (1 - \bar{p})L$ positive forecast.
